

Criteria	Mastering	Developing	Emerging	Missing	Criterion Score
Readability	30 points Well thought out, organized, and presented: the proof can be fully understood by a fellow 1st-year student without any additional explanation. The proof is concise but without making any sacrifices to correctness, completeness, and clarity.	20 points Effort at organization and presentation is apparent, but improvements can be made (e.g. paragraph structure, references to applied theorems, text/formula balance etc.) Lack of conciseness: although the proof is (mostly) correct, it is longer than necessary.	10 points Some parts of the proof take considerable effort to read. Certain arguments need additional clarification. Arguments are needlessly complex and distract from the key points.	0 points No coherent flow of ideas. The work only lists facts without providing any logical links between them. The submitted work consists solely of strings of formula's without any explanatory sentences connecting them. Completely illegible handwriting.	/ 30
Validity	55 points All steps are correct and thoroughly explained.	40 points Some steps contain errors, but these can be corrected and do not compromise the overall approach. The work will qualify as a mathematical proof if errors are corrected.	25 points Key steps contain errors that cannot be easily corrected and compromise the overall approach. Inappropriate application of theorems (e.g. wrong/irrelevant theorem or conditions are not checked). Unjustified or improperly justified statements or conclusions.	0 points No solution attempted or no meaningful mathematics written. Answer without any explanation. Significantly inaccurate or irrelevant statements.	/ 55
Fluency	15 points Mathematical notation and terminology are used flawlessly (i.e. as done in Abbott's book).	10 points Mathematical notation and terminology are used correctly with only a few exceptions.	5 points Systematic errors in mathematical notation (e.g. using { } to denote a sequence or () to denote a set).	0 points Consistent misuse of mathematical notation and terminology. Symbols are never defined. Frequent changes of notation.	/ 15
